1

Takeaway Message

- › A SNP profile that can be uploaded to genetic genealogy (GG) databases is **NOT** enough for a GG case to be workable
- › The data has to be of **high enough quality** that the GG database matches are reliable (i.e. the amount of shared DNA reflects the true relationship)
- › Low-quality data (e.g. mixtures) can result in missing matches, spurious matches, and/or incorrect DNA sharing amounts, which make GG extremely difficult

2

Data for Genetic Genealogy

› Genome-wide SNP data:

#	rsid	chromosome	position	genotype
rs3094315	1	752566	AA	
rs3131972	1	752721	GG	
rs12124819	1	776546	AA	
rs11240777	1	798959	AG

3

Generate SNP Data: Microarray 

› Microarray Genotyping

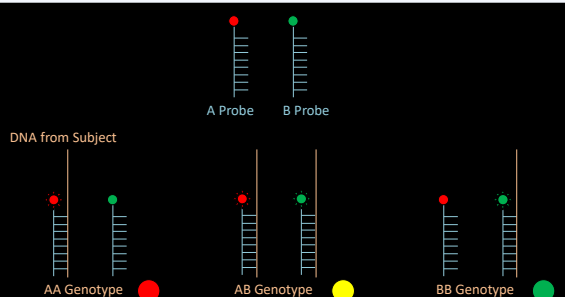

- Cost effective
- CytoSNP-850K chip designed for lower-quality samples
- Appropriate for most samples (≥ 1 ng)
- GREAT for mixtures!

4

Generate SNP Data: Microarray 

› 50-base pair fluorescent probes test for the presence of each allele

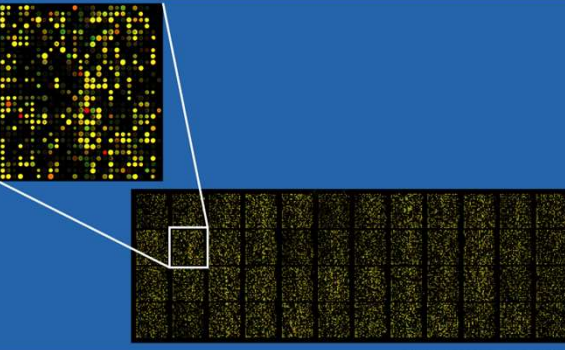

DNA from Subject

A Probe B Probe

AA Genotype AB Genotype BB Genotype

5

Generate SNP Data: Microarray 

6

Generate SNP Data: Microarray

- › Scanner measures the amount of fluorescent signal of each color at each probe
- › Software clusters signals to call genotypes

Colored Points:
Samples with called genotypes at this SNP

Black Points:
Samples with missing genotypes at this SNP

- › Assess quality using **call rate** (proportion of targeted SNPs with a genotype call)

7

rs28391282	1	904165	GG	AG

13

IBD Segment Detection

Chromosome 1

≥ 7 centimorgans (cM)
≥ 200-400 SNPs
IBD Segment!

14

Mixed Samples

- › DNA from the person-of-interest (POI) is mixed with DNA from another person, usually the victim
- › A single-source sample from the victim is usually available
- › What effect does this have on the data and the GG database matches?

15

Mixed Sample Genotypes: 20% 

- › 80% POI + 20% Victim → “20% Mixture”
- › AA + AA → AA **Correct**
- › AB + AB → AB **Correct**
- › BB + BB → BB **Correct**
- › AA/BB + AB → AA/BB **Correct or Missing**
- › AB + AA/BB → AB **Correct or Missing**
- › AA + BB → NN **Missing**
- › SNPs are **correct** or **missing**

16

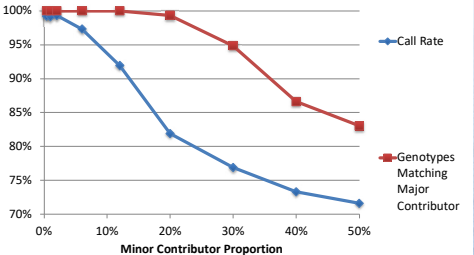

Mixed Sample Genotypes: 50% 

- › 50% POI + 50% Victim → “50% Mixture”
- › AA + AA → AA **Correct**
- › AB + AB → AB **Correct**
- › BB + BB → BB **Correct**
- › AA/BB + AB → NN **Missing**
- › AB + AA/BB → NN **Missing**
- › AA + BB → AB **Incorrect**
- › Called SNPs are either **incorrect heterozygotes** or **shared**

17

Microarray for Mixed Samples 

- › Laboratory-created mixtures → genotyping
- › Mixing decreases call rate and accuracy

Minor Contributor Proportion	Call Rate (%)	Genotypes Matching Major Contributor (%)
0%	100	100
10%	92	100
20%	82	98
30%	76	94
40%	73	86
50%	72	83
